```

fun facts (1)

Computers evaluate the right-hand side of an equation and put the result in the left hand side:

- x=y+1 means that x receives the value y+1
- Careful: x=x+1 means that x+1 is first computed and its value stored in the variable x (thereby replacing the old previous value)

triangles & Co.

Write a program to accept the coordinates of three points and report back whether this points define an equilateral, isosceles, or scalene triangle.

▲ロト ▲帰ト ▲ヨト ▲ヨト 三日 - の々ぐ

(do three points always define a triangle ?)

If you take a positive integer, halve it if it is even of triple it and add one if it is odd, and repeat, then you will ultimately obtain one.
